

ABSTRACT

A storage system comprising two or more pouches (100, 200, 300), joined sequentially pouch-lip to pouch-lip by a flexible coupling portion (30), wherein each coupling portion flexes to permit manipulation of the joined set of pouches, combines advantageous modes of storage, display and access, such as paging, tipping/fan, accordion, parallel, push down, reverse parallel, and pull up modes, with a greatly simplified manufacturing process.
